You can sort your dictionary to obtain a tuple array of (key, value) pairs and then utilize it.

167

```swift
struct ContentView: View {
    let dict = ["key1": "value1", "key2": "value2"]

    var body: some View {
        List {
            ForEach(dict.sorted(by: >), id: \.key) { key, value in
                Section(header: Text(key)) {
                    Text(value)
                }
            }
        }
    }
}
```

or loop over the keys of the dictionary

```swift
struct ContentView: View {
    let dict = ["key1": "value1", "key2": "value2"]

    var body: some View {
        List {
            ForEach(Array(dict.keys), id: \.self) { key in
                Section(header: Text(key)) {
                    Text(dict[key] ?? "")
                }
            }
        }
    }
}
```
